

SPECIAL OPTION PHOTO SAFETY SENSORS

Felins introduces the latest in added machine safety with it's new electronic photo safety sensors. These sensors are integrated into the Direct Drive System and have a four inch high field of vision. They are located directly under the table at the leading edge of the delivery arm entry slot.

They are designed to prevent the operation of the machine while any object is directly in the path of the twine delivery arm as it travels through the stainless steel table top. They also instantly stop the machine during it's cycle if any object is accidentally moved into the path of the delivery arm as it moves.

These new features together with our exclusive Breakaway Arm offer you the safest, most user friendly machine available today.
